To the hiring team

Dear Hiring Team,

> *I'm writing because I'm looking for something specific: a senior role where Customer Success, data and AI stop living in separate departments and become one system. I've spent 16 years building that intersection, the last 5 writing the code that runs it myself.*

At Bodytone I designed the data architecture, the Power BI dashboards and the Zendesk support system from scratch, and automated much of the team's manual work with Python and generative AI. Before that, at Minderest, I managed up to 80 global B2B SaaS clients, including the company's top account, and led pricing strategy through competitive intelligence. These aren't parallel projects: it's the same logic applied to two sides of the same problem, understanding the customer and building what that understanding demands.

I work with a method that repeats on every project: I listen to the customer and the operation, decide what deserves solving first, build the minimum system that solves it, and stay until the team actually activates it. That last part, adoption, is what gets lost most often when the technology isn't designed by someone who has also led people. I've spent 10 years doing exactly that, on the front line.

My portfolio documents four systems built end to end, including one that is public and verifiable in production. I would welcome the chance to talk about how to bring that same way of working to your team.

I'm happy to talk whenever works for you.

Kind regards,

Gracián Baena
Customer Success Systems & Data Strategist

How I work

1. **Listen.** To the customer and the operation, as they really work.
2. **Decide.** What deserves solving first.
3. **Build.** The minimum system that solves it.
4. **Activate.** Stay until the team actually uses it.

In numbers

16+ years of professional experience

10+ years working with clients and teams

5 years building automation and AI

200 algorithms in my largest budget generator
